MAIL DATE	DELIVERY MODE
-----------	---------------

11/24/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/664,450	Applicant(s) DOGANATA ET AL.	
	Examiner MAHESH H. DWIVEDI	Art Unit 2168	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 08 August 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,4-9 and 12-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1, 4-9, and 12-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 16 March 2007 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Remarks

1. Receipt of Applicant's Amendment, filed on 08/08/2008, is acknowledged. The amendment includes the amending of claims 1, 5-8, 12-13, and 17, and the cancellation of claims 2-3, and 10-11.

Claim Rejections - 35 USC § 112

2. The rejections raised in the office action mailed on 04/17/2008 have been overcome by applicant's amendments received on 08/08/2008.

Claim Objections

3. The objections raised in the office action mailed on 04/17/2008 have been overcome by applicant's amendments received on 08/08/2008.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1, 4-9. and 12-20 rejected under 35 U.S.C. 102(b) as being anticipated by **Doganata et al.** (Article entitled "DBLue: An Advanced Enterprise Information Search and Delivery System", published on January 01, 2000).

6. Regarding claim 1, **Doganata** teaches a search system comprising:

A) a search system analysis system that periodically looks through a log of search queries of the search system and identifies, for analyzing, unsatisfactory, for analyzing, unsatisfactory customer search queries that do not bring satisfactory results from a database being searched by the customers (Pages 4-5);

B) a search query analyzer using one or more of glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to original search query terms in the unsatisfactory customer search queries (Pages 4-5);

Art Unit: 2168

C) a relevant document finder based on enhanced queries including the alternative query terms to locate relevant documents in the searched database not found when the unsatisfactory customer search queries were used (Pages 4-5); and

D) embedding in located relevant documents not found by the unsuccessful search queries those of the original unsuccessful search query terms not contained in those relevant documents (Pages 4-5).

The examiner further notes that **Doganata** teaches “**a search system analysis system that periodically looks through a log of search queries of the search system and identifies, for analyzing, unsatisfactory, for analyzing, unsatisfactory customer search queries that do not bring satisfactory results from a database being searched by the customers**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a search query analyzer using one or**

Art Unit: 2168

more of glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to original search query terms in the unsatisfactory customer search queries” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a relevant document finder based on enhanced queries including the alternative query terms to locate relevant documents in the searched database not found when the unsatisfactory customer search queries were used”** as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so

Art Unit: 2168

on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata** teaches **“embedding in located relevant documents not found by the unsuccessful search queries those of the original unsuccessful search query terms not contained in those relevant documents”** as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and

Art Unit: 2168

their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5).

Regarding claim 4, **Doganata** further teaches a computer program comprising:
A) associating enhanced queries with the unsatisfactory search queries in the search system log for use with further queries (Pages 4-5).

The examiner notes that **Doganata** teaches **"associating enhanced queries with the unsatisfactory search queries in the search system log for use with further queries"** as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5).

Regarding claim 5, **Doganata** further teaches a search system comprising:
A) including ranking the results of searches using both the unsatisfactory and the enhanced search queries (Pages 4-5).

The examiner notes that **Doganata** teaches “**including ranking the results of searches using both the unsatisfactory and the enhanced search queries**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 6, **Doganata** further teaches a search system comprising:
A) wherein the search query analyzer comprises a module including: a sub-module that identifies domain specific terms in a given unsuccessful search query, using domain specific glossary (Pages 4-5);

Art Unit: 2168

- B) a sub-module that finds synonyms and related terms for the identified domain specific terms, using domain specific thesaurus (Pages 4-5);
- C) a sub-module that finds other statistically close terms (Pages 4-5); and
- D) a sub-module that identifies relevant domain specific categories for the identified terms, using domain specific ontology (Pages 4-5).

The examiner notes that **Doganata** teaches “**wherein the search query analyzer comprises a module including: a sub-module that identifies domain specific terms in a given unsuccessful search query, using domain specific glossary**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a sub-module that finds synonyms and related terms for the identified domain specific terms, using domain specific thesaurus**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of

Art Unit: 2168

documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a sub-module that finds other statistically close terms**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a sub-module that identifies relevant domain specific categories for the identified terms, using domain specific ontology**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM

Art Unit: 2168

technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5).

Regarding claim 7, **Doganata** further teaches a search system comprising:

- A) wherein the document finder comprises a module including the following sub-modules: a sub-module that finds the relevant documents in the identified categories, using an original textual index (Pages 4-5); and
- B) a sub-module that filters the found relevant documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms (Pages 4-6).

The examiner notes that **Doganata** teaches “**wherein the document finder comprises a module including the following sub-modules: a sub-module that finds the relevant documents in the identified categories, using an original textual index**” as “The way the system is architected allows combining keyword search with navigational search. Based on a topic or a document type, users can narrow down search findings with a single click. This increases the chances of finding the requested information when the user query isn’t specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM’s product offerings and the document types.” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a sub-module that filters the found relevant documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms**” as “This increases the chances of finding the requested information when the user query isn’t specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM’s product offerings and the document types” (Pages 4-5), “The search results contain the documents that are indexed against the query terms and scored based on certain

Art Unit: 2168

statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5), and "In the near future, customers will be able to ask questions in natural language and the system won't require an exact match of words. In the near future, dBlue will also personalize searching so that once a user fills out a profile, responses will be filtered and ranked based on that profile. Multilanguage searches for documents written in Japanese, Chinese, and French will be supported by late 2002" (Page 6).

Regarding claim 8, **Doganata** further teaches a search system comprising:

- A) including a linking meta-data enhancer with the following sub-modules: a sub-module that creates associations (links) between each found relevant document and the given unsuccessful search query (Pages 4-5); and
- B) a sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries (Pages 4-5).

The examiner notes that **Doganata** teaches "**including a linking meta-data enhancer with the following sub-modules: a sub-module that creates associations (links) between each found relevant document and the given unsuccessful search query**" as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms

Art Unit: 2168

exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata teaches “a sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries”** as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition,

statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 9, **Doganata** teaches a computer program comprising:

- A) a search system analog system software module that periodically looks through a log for the search system and selects for analyzing unsuccessful customer search queries (Pages 4-5);
- B) a search query analyzer software module using one or more of glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to the terms used in the unsuccessful search queries (Pages 4-5);
- C) a relevant document finder software module using enhanced queries including the alternative query terms to locate relevant documents not found using said unsuccessful customer search queries (Pages 4-5); and
- D) software for embedding search query terms of the unsuccessful queries in the documents located by the enhanced queries and not found by the unsuccessful customer search so that the documents located by the enhanced queries will be found if the unsuccessful customer search queries are repeated (Pages 4-5).

The examiner notes that **Doganata** teaches “**a search system analog system software module that periodically looks through a log for the search system and selects for analyzing unsuccessful customer search queries**” as “The search results contain the documents that are indexed against the query terms and scored

Art Unit: 2168

based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further notes that **Doganata teaches "a search query analyzer software module using one or more of glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to the terms used in the unsuccessful search queries"** as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary.

Art Unit: 2168

The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a relevant document finder software module using enhanced queries including the alternative query terms to locate relevant documents not found using said unsuccessful customer search queries**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for

Art Unit: 2168

related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further notes that **Doganata** teaches **"software for embedding search query terms of the unsuccessful queries in the documents located by the enhanced queries and not found by the unsuccessful customer search so that the documents located by the enhanced queries will be found if the unsuccessful customer search queries are repeated"** as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5).

Regarding claim 12, **Doganata** further teaches a computer program comprising:

Art Unit: 2168

A) software for providing associated enhanced keyword queries with keywords from the unsatisfactory queries in the search system log for use in connection with further customer queries (Pages 4-5).

The examiner notes that **Doganata** teaches “**software for providing associated enhanced keyword queries with keywords from the unsatisfactory queries in the search system log for use in connection with further customer queries**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 13, **Doganata** further teaches a computer program comprising:
A) including software for ranking results of searches in order of their pertinency using the enhanced keyword query terms as a ranking basis (Pages 4-5).

The examiner notes that **Doganata** teaches “**including software for ranking results of searches in order of their pertinency using the enhanced keyword query terms as a ranking basis**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 14, **Doganata** further teaches a search system comprising:

- A) wherein the search query analyzer software module comprises: a software module that identifies domain specific terms in a given query, using domain specific glossary (Pages 4-5);
- B) a software sub-module that finds synonyms and related terms for the identified terms, using domain specific thesaurus (Pages 4-5);
- C) a software sub-module that finds other statistically close terms (Pages 4-5); and

Art Unit: 2168

D) a software sub-module that identifies relevant domain specific categories for the identified terms, using domain specific ontology (Pages 4-5).

The examiner notes that **Doganata** teaches “**wherein the search query analyzer software module comprises: a software module that identifies domain specific terms in a given query, using domain specific glossary**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a software sub-module that finds synonyms and related terms for the identified terms, using domain specific thesaurus**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition,

statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a software sub-module that finds other statistically close terms**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a software sub-module that identifies relevant domain specific categories for the identified terms, using domain specific ontology**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other

Art Unit: 2168

information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5).

Regarding claim 15, **Doganata** further teaches a computer program comprising:

- A) a document finder module that comprises the following software sub-modules: a software sub-module that finds documents in the identified categories, using the original textual index (Pages 4-5); and
- B) a software sub-module that filters the found documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms (Pages 4-6).

The examiner notes that **Doganata** teaches “**a document finder module that comprises the following software sub-modules: a software sub-module that finds documents in the identified categories, using the original textual index**” as “The way the system is architected allows combining keyword search with navigational search. Based on a topic or a document type, users can narrow down search findings with a single click. This increases the chances of finding the requested information when the user query isn’t specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM’s product offerings and the document types.” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a software sub-module that filters the found documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms**” as “This increases the chances of finding the requested information when the user query isn’t specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM’s product offerings and the document types” (Pages 4-5), “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can’t be found or may not appear at the top of the search results because they are scored low or they don’t contain the terms exactly as in the query. This is common when users choose

Art Unit: 2168

variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5), and “In the near future, customers will be able to ask questions in natural language and the system won't require an exact match of words. In the near future, dBlue will also personalize searching so that once a user fills out a profile, responses will be filtered and ranked based on that profile. Multilanguage searches for documents written in Japanese, Chinese, and French will be supported by late 2002” (Page 6).

Regarding claim 16, **Doganata** further teaches a computer program comprising:

- A) wherein a meta-data enhancer module comprises the following sub-modules: a software sub-module that creates associations (links) between each found document and the given query (Pages 4-5); and
- B) a software sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries (Pages 4-5).

The examiner notes that **Doganata** teaches “**wherein a meta-data enhancer module comprises the following sub-modules: a software sub-module that creates associations (links) between each found document and the given query**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This

Art Unit: 2168

process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further notes that **Doganata teaches "a software sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries"** as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary

tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 17, **Doganata** teaches a search system comprising:

- A) a search system analysis system that periodically looks through a search system log and identifies for analysis unsatisfactory customer search queries that do not cite more than a specified number of references (Pages 4-5);
- B) a search query analyzer using one or more of the glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to original query terms in the unsatisfactory customer search queries identified by the search system analysis system (Pages 4-5);
- C) a relevant document finder based on enhanced queries including the alternative query terms to locate relevant documents not found by the original unsatisfactory customer search queries identified by the search system analysis system (Pages 4-5); and
- D) a meta-data enhancer creating separate enhances links to one or more of said relevant documents linking to said relevant documents the original terms of the unsatisfactory search queries and not found in the relevant documents so that future search queries using the original terms will result in finding said relevant documents not found by the unsatisfactory customer search queries (Pages 4-5).

The examiner notes that **Doganata** teaches “**a search system analysis system that periodically looks through a search system log and identifies for analysis unsatisfactory customer search queries that do not cite more than a specified number of references**” as “The search results contain the documents that are indexed

Art Unit: 2168

against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further notes that **Doganata** teaches **"a search query analyzer using one or more of the glossary terms, synonyms, known typographical errors and translated words to provide alternative query terms to original query terms in the unsatisfactory customer search queries identified by the search system analysis system"** as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of

Art Unit: 2168

documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a relevant document finder based on enhanced queries including the alternative query terms to locate relevant documents not found by the original unsatisfactory customer search queries identified by the search system analysis system**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create

Art Unit: 2168

keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further notes that **Doganata** teaches "**a meta-data enhancer creating separate enhances links to one or more of said relevant documents linking to said relevant documents the original terms of the unsatisfactory search queries and not found in the relevant documents so that future search queries using the original terms will result in finding said relevant documents not found by the unsatisfactory customer search queries**" as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5).

Regarding claim 18, **Doganata** further teaches a search system comprising:

A) wherein said meta-data enhancer links the alternative query terms to the original query terms to automatically locate said relevant documents (Pages 4-5).

The examiner notes that **Doganata** teaches “**wherein said meta-data enhancer links the alternative query terms to the original query terms to automatically locate said relevant documents**” as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5).

Regarding claim 19, **Doganata** further teaches a search system comprising:

Art Unit: 2168

- A) wherein the relevant document finder module comprises the following sub-modules: a sub-module that finds documents in identified categories, using the original textual index (Pages 4-5); and
- B) a sub-module that filters the found documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms (Pages 4-6).

The examiner notes that **Doganata** teaches “**wherein the relevant document finder module comprises the following sub-modules: a sub-module that finds documents in identified categories, using the original textual index**” as “The way the system is architected allows combining keyword search with navigational search. Based on a topic or a document type, users can narrow down search findings with a single click. This increases the chances of finding the requested information when the user query isn’t specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM’s product offerings and the document types.” (Pages 4-5). The examiner further notes that **Doganata** teaches “**a sub-module that filters the found documents to find additional relevant documents, based on the identified domain specific terms, synonyms, related terms, and statistically close terms**” as “This increases the chances of finding the requested information when the user query isn't specific enough to narrow down the search results on the first attempt. The categorized results are returned with the option of filtering the results based on IBM's product offerings and the document types” (Pages 4-5), “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific

Art Unit: 2168

glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5), and "In the near future, customers will be able to ask questions in natural language and the system won't require an exact match of words. In the near future, dBlue will also personalize searching so that once a user fills out a profile, responses will be filtered and ranked based on that profile. Multilanguage searches for documents written in Japanese, Chinese, and French will be supported by late 2002" (Page 6).

Regarding claim 20, **Doganata** further teaches a computer program comprising:

- A) wherein the meta-data enhancer module comprises the following sub-modules: a sub-module that creates associations (links) between each found document and the given query (Pages 4-5); and
- B) a sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries (Pages 4-5).

The examiner notes that **Doganata** teaches "**wherein the meta-data enhancer module comprises the following sub-modules: a sub-module that creates associations (links) between each found document and the given query**" as "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This

Art Unit: 2168

initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible” (Pages 4-5). The examiner further notes that **Doganata teaches “a sub-module that adds new doc-query links to the meta-data of the corresponding textual index entries”** as “The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms. The process of generating and enhancing the glossary is semi-automatic, using glossary tools and the librarian. Figure 4 shows the multiple components that compose the glossary of technical terms built for the dBlue system” (Pages 4-5) and “Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the

document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5).

7. Claims 1, 4-9, and 12-20 are rejected under 35 U.S.C. 102(b) based upon a public use or sale of the invention. Specifically, the cited art of **Doganata et al.** (published on January 01, 2000) details the dBlue system which enhances meta-data of indexed documents by embedding misspellings, synonyms, etc., just as the claimed invention does.

Response to Arguments

8. Applicant's arguments filed 08/08/2008 have been fully considered but they are not persuasive.

Applicants argue on page 13 that **"applicants attorney wishes to point out that the article was not first published on 1/1/00 but on 10/21/02 and therefore does not constitute a bar under 35 USC 102(b) nor does it show that the present invention may have been in public use in the United States for more than one year before filing of this application. See Appendix A containing a note from Dr. Moon J. Kim, one of the authors of the article and a co-inventor of this application, along with a copy of the article containing the proper publication date of October 21, 2002"**. However, applicants arguments are not persuasive. A simple statement from one the instant inventors is insufficient to disqualify **Doganata**. According to the MPEP 715.04, "An affidavit is a statement in writing made under oath before a notary public, magistrate, or officer authorized to administer oaths. See MPEP § 604 through § 604.06 for additional information regarding formal requirements of affidavits. 37 CFR 1.68 permits a declaration to be used instead of an affidavit. The declaration must include an acknowledgment by the declarant that willful false statements and the like are punishable by fine or imprisonment, or both (18 U.S.C. 1001) and may jeopardize the validity of the application or any patent issuing thereon. The declarant must set forth in the body of the declaration that all statements made of the declarant's own knowledge are true and that all statements made on information

Art Unit: 2168

and belief are believed to be true". Because no affidavit nor declaration was submitted, the attempt by the applicant to disqualify **Doganata** is not persuasive.

Applicants argue on page 13 that **"The applicants' attorney did not find anything in the Donigata et al article about searching the log of the database for customers unsatisfactory search queries and then adding keywords in those unsatisfactory queries as meta/data to the applicable documents missed by such queries"**. However, the examiner wishes to refer to Pages 4-5 of **Doganata** which state "The search results contain the documents that are indexed against the query terms and scored based on certain statistical criteria. In many real-life situations, the relevant documents can't be found or may not appear at the top of the search results because they are scored low or they don't contain the terms exactly as in the query. This is common when users choose variations of the query terms, including inflections, misspellings, abbreviations, and so on. To improve the user experience, dBlue uses text analysis tools developed by IBM Research to enhance the contents of documents. This process is started by extracting terms from a large collection of documents in the IBM technical support domain to create a domain-specific glossary. The terms in the glossary can consist of canonical form, variant form (inflection, abbreviation, misspelling, etc.), synonym, term definition, statistical data, and other information. This initial glossary is enhanced by eliminating irrelevant terms and reranking terms using special dictionaries and algorithms" (Pages 4-5) and "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to enrich the content of the document. The content enrichment is used to create keyword metatags for biased indexing, expand the query terms to include related terms, and enable search for related documents. To improve the user's search experience, keywords are displayed in the search results and navigating through keywords is possible" (Pages 4-5). The examiner further wishes to state that it is clear that meta-data of searchable documents is enhanced by **Doganata** through the additions of synonyms/incorrect spellings/etc. (See "Based on the glossary, the important keywords in each document are extracted and ranked, and their related glossary terms (variants, synonyms, etc.) are used to

enrich the content of the document"). Moreover, because **Doganata** refers to using search results in enhancing searchable documents, then as a result, **Doganata** broadly teaches the aforementioned limitation.

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

U.S. PG PUB 2005/0065773 issued to **Huang et al.** on 24 March 2005. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. PG PUB 2004/0254920 issued to **Brill et al.** on 16 December 2004. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 7,051,023 issued to **Kapur et al.** on 23 May 2006. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 7,136,845 issued to **Chandrasekar et al.** on 14 November 2006. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 6,169,986 issued to **Bowman et al.** on 02 January 2001. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. PG PUB 20040249808 issued to **Azzam et al.** on 09 December 2004. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. PG PUB 2005/0055341 issued to **Haahr et al.** on 10 March 2005. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 6,941,294 issued to **Flank** on 06 September 2005. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 7,197,508 issued to **Brown** on 27 March 2007. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 7,127,456 issued to **Brown** on 24 October 2006. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 6,338,055 issued to **Haggmann** on 08 January 2002. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. PGPUB 2002/0095621 issued to **Lawton et al.** on 18 July 2002. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

Article entitled "An Advanced Enterprise Information Search and Delivery System: Fulfilling IBM's one-Web vision" by **Doganata et al.**, dated 14 October 2002. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

U.S. Patent 6,772,150 issued to **Whitman et al.** on 03 August 2004. The subject matter disclosed therein is pertinent to that of claims 1, 4-9, and 12-20 (e.g., methods the enhance the meta data of indexed documents).

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 2168

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Contact Information

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mahesh Dwivedi whose telephone number is (571) 272-2731. The examiner can normally be reached on Monday to Friday 8:20 am – 4:40 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tim Vo can be reached (571) 272-3642. The fax number for the organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
